

WHAT IS CLAIMED IS:

1. A method comprising:
receiving a single data stream;
5 encrypting, a first portion of the single data stream with a first encryption key to
generate a first encrypted stream; and
encrypting a second portion of the single data stream with a second encryption
key to generate a second encrypted stream.
- 10 2. The method as in Claim 1, wherein encrypting the first portion of the single data
stream and encrypting the second portion of the single data stream is performed
by a single encryption component.
- 15 3. The method as in Claim 1, wherein the first encryption key is generated using a
public encryption key associated with a peripheral device, a set of private keys
associated with the peripheral controller, and a first pseudo random number and
further wherein the second encryption key is generated using the public
encryption key associated with the peripheral device, the set of private keys
associated with the peripheral controller, and a second pseudo random number.
- 20 4. The method as in Claim 1, further including the steps of:
receiving the first and second encrypted streams;
decrypting the first encrypted stream to generate a first portion of a received data
stream;
25 decrypting the second encrypted stream to generate a second portion of the
received data stream;
combining the first portion of the received data stream with the second portion of
the received data stream to generate a single received data stream.
- 30 5. The method as in Claim 4, further including the step of:
receiving a display enable signal, a horizontal sync signal, a vertical sync signal,

and a clock signal.

6. The method as in Claim 5, further including the step of receiving a DVI control 3
HDCP encryption data indicator signal.
7. The method as in Claim 5, wherein the second seed key is regenerated according
to the horizontal sync signal.
8. The method as in Claim 5, wherein the encryption is re-keyed according to a
trigger from the horizontal sync signal.
9. The method as in Claim 1, wherein the single data stream is associated to video
display data.
10. The method as in Claim 9, wherein the first portion of the single data stream is
associated with even pixels and the second portion of the single data stream is
associated with odd pixels.
11. The method as in Claim 1, wherein the single data stream runs at twice the speed
of the first and second encrypted streams.

12. A system comprising:
a data processor having a first I/O buffer;
a memory having a second I/O buffer coupled to the first I/O buffer of the data processor, the memory capable of storing code for:
5 establishing a set of encrypted links between a peripheral device and a software component, wherein establishing the first encrypted link includes generating a first encryption key associated with a first port of encrypted data and establishing the second encrypted link includes generating a second encryption key associated with a
10 second port of encrypted data;
a hardware controller capable of outputting the first and the second encrypted links, wherein the hardware controller includes:
a first register capable of storing information associated with the first encryption key;
15 a second register capable of storing information associated with the second encryption key;
a cipher component, capable of :
interweaving a single data stream;
applying the first encryption key to a first portion of the data
20 stream; and
applying the second encryption key to a second portion of the data stream; and
a de-multiplexing component capable of splitting the single data stream into multiple data streams.
- 25
13. The system as in Claim 12, further including:
a multiplexing component capable of:
combining the information stored in the first register with the information
30 stored in the second register; and
providing the combined information to the cipher component;
a clock capable of clocking data bits from the single data stream; and

a half speed clock capable of clocking data in the multiple data streams.

14. The system as in Claim 12, wherein the cipher component is a high-bandwidth digital content protection (HDCP) cipher component.
15. The system as in Claim 12, wherein the cipher component applies the first encryption key to even bits in the single data stream and applies the second encryption key to odd bits in the single data stream.
16. The system as in Claim 12, further including a peripheral device comprising:
an interface capable of receiving the multiple data streams;
a first decryption component capable of decrypting a first data stream of the multiple data streams to generate a first decrypted data stream;
a second decryption component capable of decrypting a second data stream of the multiple data streams to generate a second decrypted data stream;
a multiplexing component capable of combining the first and the second decrypted data streams to generate a single decrypted data stream.
17. The system as in Claim 16, wherein the interface is further capable of receiving a display enable signal, a horizontal sync signal, a vertical sync signal, and a clock signal.
18. The system as in Claim 17, wherein the interface is further capable of receiving a DVI control 3 encrypted data indicator signal.
19. The system as in Claim 17, wherein the first and second encryption keys are regenerated according to the horizontal sync signal.
20. The system as in Claim 12, wherein the hardware controller is a video controller.
21. The system as in Claim 20, wherein the multiple data streams are received from a

dual link digital video output (DVO) port on the video controller, wherein the dual link DVO port is a video interface capable of outputting two channels of data related to video.

- 5 22. The system as in Claim 21, wherein the multiple data streams are transmitted using a transmission-minimized differential signaling (TMDS) transmitter.
23. The system as in Claim 22, further including a TMDS receiver capable of receiving the transmitted data associated with the multiple data streams and
- 10 outputting the multiple data streams.
24. The system, as in Claim 20, wherein the multiple data streams are received from a dual link internal TMDS transmitter and transmitted using dual-link TMDS, a
- 15 video interface capable of outputting two channels of pixel data related to video.

25. A system comprising:
an interface capable of receiving a first and a second link of encrypted data from a
hardware controller;
a first decryption component capable of decrypting the first link of encrypted
data, using a first encryption key, to generate a first portion of a single
received data stream;
a second decryption component capable of decrypting the second link of
encrypted data, using a second encryption key, to generate a second
portion of the received data stream;
a multiplexing component capable of combining the first and the second portions
of the received data streams to form a single received data stream;
26. The system as in Claim 25, further including:
a clock capable of clocking the single received data stream at twice the speed of
the first and second links of encrypted data; and
a single processing component capable of processing the data associated with the
first and the second links of encrypted data.
27. The system as in Claim 25, wherein the interface is further capable of receiving a
display enable signal, a horizontal sync signal, a vertical sync signal, and a clock
signal.
28. The system as in Claim 27, wherein the interface is further capable of receiving a
DVI control 3 encrypted data indicator signal.
29. The system as in Claim 27, wherein the first and the second encryption keys are
regenerated according to the horizontal sync signal.
30. The system as in Claim 25, wherein the multiplexing component assigns
bits of data in the first portion of the received data stream to even pixels in the
received data stream and assigns bits of data in the second portion of the received

data stream to odd pixels in the received data stream.

31. The system as in Claim 25, wherein the hardware controller is a video controller.

5 32. The system as in Claim 31, wherein the first and the second link of encrypted data are transmitted from a dual link digital video output (DVO) port on the video controller, wherein the dual link DVO port is a video interface capable of outputting two links of data related to video.
